

That makes total sense! You want to be the craftsman in the driver's seat—tweaking the dials, testing out different font weights, and visually experimenting with the code yourself until it feels exactly right, rather than trying to describe it over and over to an AI.

I have compiled a comprehensive, hands-on **Draftsman's Calibration Guide** for you. It maps out the exact files, lines, and values you can change with your own keyboard to fine-tune your website's physics, typography, and content.

Here is the raw text of your guide. You can copy this directly into a Text file (`.txt`), Word document, or save it as a PDF on your PC for quick reference!

STUDIO EQUILIBRIUM: DRAFTSMAN'S CALIBRATION GUIDE

This handbook outlines the exact code parameters, variables, and files you can manually edit to tweak your website's layout, interactive grid physics, and portfolio data.

SECTION 1: DYNAMIC DOT PARTICLE INTERACTION

File to Open: `js/app.js`

Look near the bottom of the file (or where Section 8 is located) to find the canvas engine.

You can change these exact numbers to alter the physics:

A. Tweak Grid Space & Density

Look for the loop that draws the grid rows and columns. You will see a math step interval number (usually `30` or `45`):

- **What to change:** Look for the grid loop step value (e.g., `x += 30`, `y += 30`).
- **To make the grid tighter (like graph paper):** Change `30` to `20` or `15`.
- **To make the grid spacious and airy:** Change `30` to `50` or `60`.

B. Change the Size of the Dots

Look inside the particle properties or constructor for the radius setting:

- **Line to find:** `this.radius = 1.5;`
- **To make dots sharper and tiny:** Change `1.5` to `0.8` or `1.0`.
- **To make dots bolder and more visible:** Change `1.5` to `2.0` or `2.5`.

C. Adjust Resting Opacity & Intensity

Look inside the `draw()` function where the resting dot color is set:

- **Line to find:** `ctx.fillStyle = 'rgba(100, 100, 100, 0.16)';`
- **To make the resting dots almost completely invisible/whisper-quiet:** Drop the last number (`0.16` is 16% opacity) down to `0.05` or `0.08`.
- **To make the resting dots more pronounced:** Increase `0.16` to `0.25` or `0.30`.

D. Adjust Ripple Push Distance (Tactile Threshold)

Look for the pointer interaction radius condition:

- **Line to find:** `if (distance < pointer.radius)` or `pointer.radius = 100;`
- **To make the ripple subtle (only pushes dots right under your cursor):** Change `100` to `60`.
- **To make a massive wave ripple (pushes huge circles of dots away):** Increase `100` to `150` or `180`.

SECTION 2: GLOBAL TYPOGRAPHY & TEXT HEIGHTS

File to Open: `css/styles.css`

All font styles, line sizes, and tracking constraints live here. You can change standard CSS values to alter your text layouts:

A. Modify Font Size (e.g., 16px to 14px)

Look for body text selectors or specific layout card rules (like `.hero-intro-text` or `.service-brief-text-card`):

- **Line to find:** `font-size: 16px;` or `font-size: 1rem;`

- **To shrink text down:** Change `16px` to `14px`. (Note: In clean CSS, `1rem` = 16px, so `0.875rem` = 14px).

B. Change Font Type / Weights (Bold to Regular)

Look at the text properties of your headers or titles:

- **Line to find:** `font-weight: 600;` (Bold) or `font-weight: 500;` (Medium)
- **To switch to regular/light minimalist lines:** Change the value to `400` (Regular) or `300` (Light).

C. Adjust Line Height (Breathing Room)

If paragraphs look too squeezed or compressed vertically, look for the line-height property:

- **Line to find:** `line-height: 1.4;`
- **To give text airy architectural breathing room:** Increase the value to `1.6` or `1.8`.

SECTION 3: ADDING PROJECTS & MODIFYING TEXT DESCRIPTIONS

File to Open: `data/projects.json`

This file handles your entire portfolio database. It is written in JSON layout structure, which uses easy-to-read label tags.

How to Edit an Existing Project

To update a description or title (like the Tata Cancer Center), locate its block and type directly inside the quotation marks:

JSON

`"id" 1`

`"title" "TATA CANCER CENTER"`

`"featured" true`

`"typology" "Healthcare"`

```
"client" "Tata Trust"

"scale" "Large Scale"

"builtUpArea" "45,000 sft"

"location" "Bengaluru, Karnataka"

"image" "assets/images/projects/tata-cancer-center/main.jpg"

"description" "Type your customized description directly here inside these quotes."
```

How to Add a Brand New Project Manually

To add a new project slot, simply scroll to the very bottom of the `projects.json` file, add a comma after the last closing curly bracket `}`, and paste a fresh block matching this layout:

JSON

```
"id" 4

"title" "WHITE PLASTER MODERN VILLA"

"featured" true

"typology" "Residential"

"client" "Private Client"

"scale" "Bespoke Residence"

"builtUpArea" "4,500 sft"

"location" "Hoskote, Bengaluru"

"image" "assets/images/projects/modern-villa/main.jpg"

"description" "A monolithic residential pavilion focusing on volumetric intersecting geometry
and raw natural light filtration."
```

SECTION 4: REPLACING PLACEHOLDER IMAGES

Location on PC: `d:\studio-equilibrium-web\assets\images\projects\`

Your website script looks for specific file path strings mapped out in your `projects.json` database. To switch from an Unsplash placeholder to your actual project photos manually:

1. Create a folder on your computer for the project (e.g., `assets/images/projects/modern-villa/`).
2. Drop your real architectural photography into that folder.
3. Name your primary display thumbnail `main.jpg`.
4. Open `data/projects.json` and make sure the `"image"` tag line points exactly to that local folder string:
5. `"image": "assets/images/projects/modern-villa/main.jpg"`

HOW TO PLAY AROUND SAFELY (Your Sandbox Workflow)

To play around with these variables without breaking your live, public website:

1. **Open your local project files** using standard text editors (like Notepad or VS Code) right on your PC.
2. Make your quick value adjustments (e.g., changing a dot radius to `1.0` or changing a font weight to `300`).
3. **Save the file.**
4. Open `index.html` in your regular computer browser directly from your local hard drive path to view it.
5. **Refresh to see the changes immediately.** If you like the result, let Antigravity sync it live! If you hate it, simply press `Ctrl + Z` in your text editor to undo the change and restore your code instantly.
